

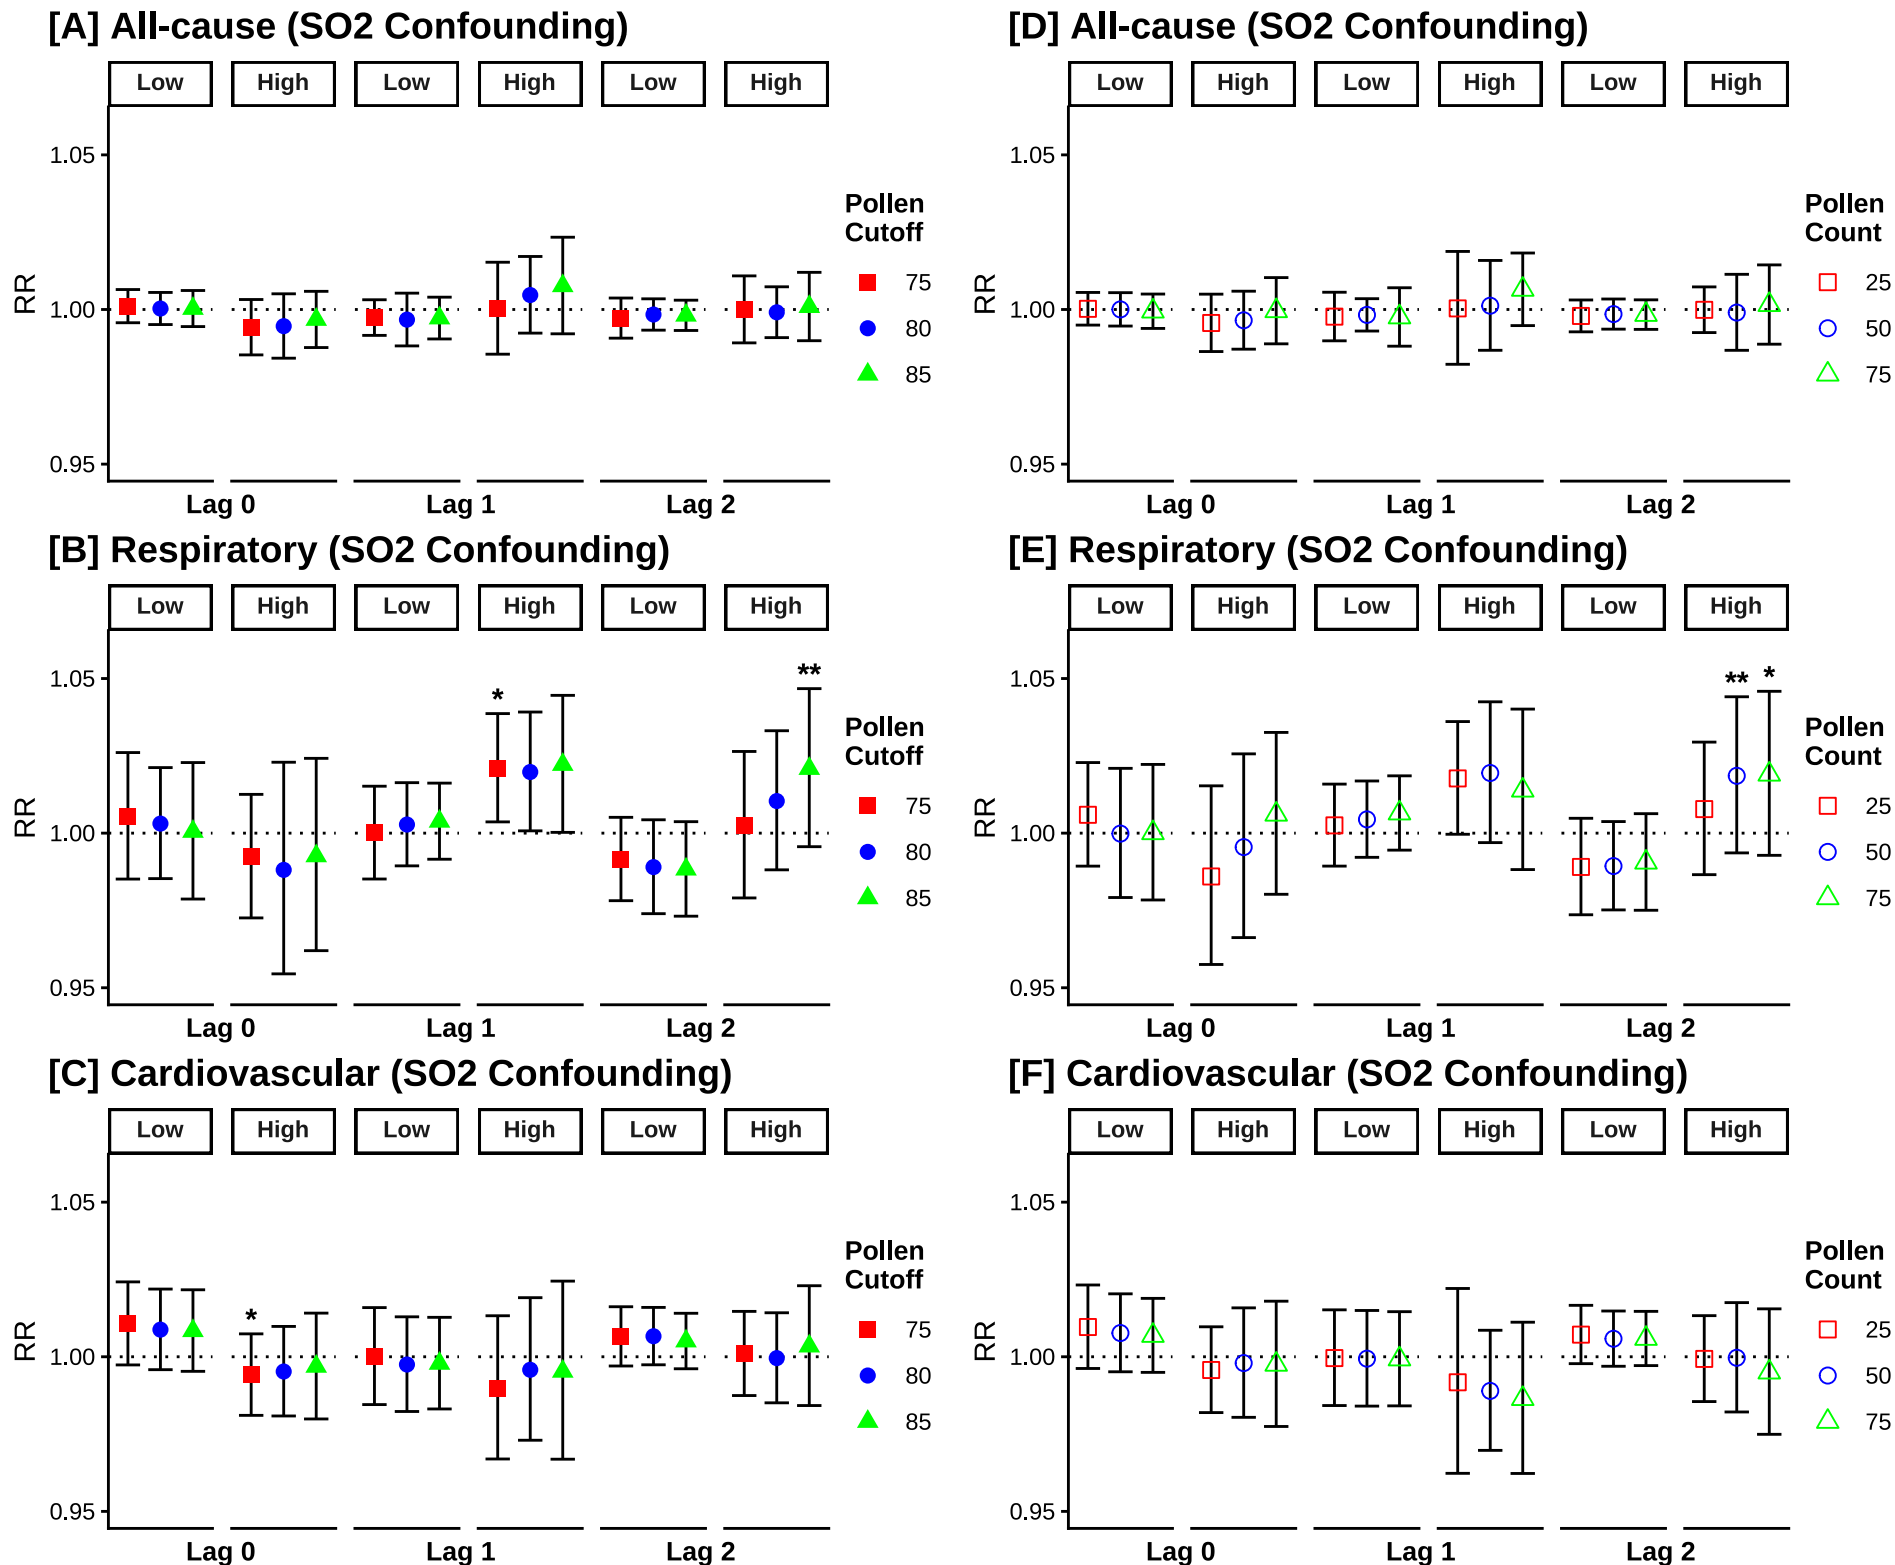

**Figure S5.** Two-pollutant model with SO<sub>2</sub> as the confounder. Association between SPM and all-cause, respiratory and cardiovascular mortality by quantiles (low or high) determined by levels of pollen cutoffs (75<sup>th</sup>, 80<sup>th</sup>, 85<sup>th</sup>) and count (25, 50, 75 grains per cm<sup>2</sup>) during the spring months (February to April) from 1989 to 2014. RR on the y-axis is defined as the relative risk per interquartile range mean (IQR) increase. Results are pooled from random-effects meta-analysis.
